

### INTRODUCING TERRALITE

The **Terralite** block is a versatile, hollow core, interlocking concrete unit - its small size means that it goes around sharp or wide convex and concave curves with ease. It also merges seamlessly from a vertical to an inclined wall and can be used to create steps by reversing the block and changing the texture.

Its applications include light retaining walls, architectural features, terracing and seating, flowerbed surrounds and tree rings. Terralite is setting new standards for low landscaping terraces, stairs and features under 36" in height. Depending

Some suppliers offer caps and colours
