

## House Callus – Kanonberg Estate

This particular installation of Terraforce L11 rock-face blocks provides for a level, spacious platform -- about 3m above road level -- around a house built on a steeply sloping erf. To soften the walls that support the fill for this platform, various flowerbeds and steps were added into the design.

Contractor: Decorton retaining

Engineer: Fred Laker I.C.O.S

The 4m wall at the back (cut section) of the house was constructed in such a way as to provide Mr Callus with a large backyard area to allow him to install a swimming pool. The wall behind the swimming pool area is spiced up with an artificial rock waterfall, along with more plantable space to soften the hardness of the very high rock-face wall.

The round curves and landscaping in and around the house ensures that this retaining installation provides not only for a practical end product, but also an attractive one.
